Introduction

- ◆ Hotel Booking System is a simple system for managing and booking hotel rooms.
- ◆ It allows users to view available rooms, make reservations, and cancel bookings easily.
- ◆ Built using Dart with Object-Oriented Programming (OOP) for efficiency and organization.

System Overview

The Hotel Booking System is a structured solution for managing hotel room reservations. It follows an object-oriented approach using Dart to ensure efficient booking management. The system operates through a Command Line Interface (CLI).

System Features

The Hotel Booking System offers essential features to simplify room reservations and management:

- **View Available Rooms** – Displays a list of rooms that can be booked.
- **Book a Room** – Allows users to reserve a room if it is available.
- **Cancel a Booking** – Enables users to cancel their reservations.
- **Track Room Availability** – Updates room status automatically after booking or cancellation.
- **User-Friendly CLI Interface** – Simple and interactive command-line interface for easy use

CONCLUSIONS

Effective booking management is essential for any hotel, and this system provides a simple yet powerful solution. By combining efficiency, flexibility, and scalability, the Hotel Booking System lays the groundwork for a more advanced and automated reservation system in the future.

But this is just the beginning! With further enhancements, this project can evolve into a complete hotel management solution—integrating payment systems, user authentication, and even AI-powered booking recommendations.

THANK
YOU!
